

# WELLUBER

## Product Requirements Document

Version 2.2 | March 2026 | Design-Ready Draft

|                     |                          |
|---------------------|--------------------------|
| Status              | Design-Ready Draft       |
| Version             | 2.2                      |
| Last Updated        | March 2026               |
| Owner               | Welluber Product Team    |
| Timeline            | 6.5-Month MVP            |
| Revenue Target (Y1) | RM 20,000 - 25,000/month |

# 1. Product Overview

Welluber is a **multi-tenant B2B2C SaaS platform** connecting Malaysian corporations, employees, and wellness service providers through a shared marketplace, wallet, and settlement engine — eliminating manual HR claim processing entirely.

## The Four Actors

| Actor              | Who They Are                                           | Interface        | Mental Model                      |
|--------------------|--------------------------------------------------------|------------------|-----------------------------------|
| Host (Welluber HQ) | Platform operator — commissions, SPs, orgs, settlement | Web Portal /host | I run the platform and take a cut |
| Organization (HR)  | Corporate HR — benefits, employees, wallet             | Web Portal /org  | I set a budget, people spend it   |
| Service Provider   | Wellness centers — packages, claims, revenue           | Web Portal /sp   | I process a customer, I get paid  |
| Member (Employee)  | End user — browse, purchase, redeem                    | React Native App | My benefits wallet + vouchers     |

## What It Is Not

- Not an HRIS. No payroll, leave, or direct HR system integration in v1. Employee data enters via CSV upload only.
- Not a wallet for service providers. SPs have zero pre-funded balance. Their account is a pure settlement ledger.
- Not a multi-currency platform. MYR only for MVP.
- Not a hardware provisioning platform.

## 2. Account Model

**Core principle:** A Welluber account is a permanent personal identity. Corporate identities are additive — they unlock employer-funded benefits but do not own the account.

Welluber Account (personal, permanent)

```
|-- Corporate Identity A  <- Employee @ Company X -- benefit wallet active
|-- Corporate Identity B  <- Employee @ Company Y -- benefit wallet active
|-- Corporate Identity C  <- Deactivated -- benefits expired, history kept
```

| Concept            | Description                                                 | Behaviour                                                        |
|--------------------|-------------------------------------------------------------|------------------------------------------------------------------|
| Welluber Account   | Root identity. Personal email, Google, or Apple SSO.        | Permanent. Never deleted when identities are removed.            |
| Corporate Identity | Employment record linked via magic link to corporate email. | Additive. One Welluber account can hold multiple identities.     |
| Deactivation       | HR deactivates when employee leaves.                        | Benefits expire immediately (default). History stays on account. |
| Pre-link State     | Member has account but no corporate identity yet.           | Marketplace browsable. Wallet and checkout gated until verified. |
| Dependent Account  | Family member linked under an employee account.             | Pool behavior governed by Policy.                                |

**Design Note:** Two-inbox model (personal email creates account, corporate email verifies employment) is security-critical. UI must clearly distinguish Welluber account from corporate identity throughout onboarding.

### 3. Service Taxonomy

Three-level hierarchy managed by Host Admin. Commission rates are configured at the **service category level** by Host Admin per SP. SPs map vouchers to Main Services and can add free-text custom sub-service labels per line — these are display-only and do not affect taxonomy or commission logic.

| Category             | Main Service             | Default Sub-services                                |
|----------------------|--------------------------|-----------------------------------------------------|
| Fitness & Exercise   | Gym Access               | Daily Pass, Monthly Membership, Annual Membership   |
|                      | Personal Training        | 1-on-1 Sessions, Small Group Training               |
|                      | Fitness Classes          | Yoga, Pilates, Zumba, HIIT, Spin Classes            |
| Massage & Bodywork   | Traditional / Relaxation | Swedish, Balinese, Aromatherapy                     |
|                      | Therapeutic Massage      | Deep Tissue, Sports Recovery, Reflexology           |
| Spa & Aesthetics     | Face & Skin Care         | Facial, Anti-Aging, Acne Treatment                  |
|                      | Body Treatments          | Body Scrub, Body Wrap, Hydrotherapy                 |
|                      | Cosmetic Procedures      | Botox, Fillers, Laser Treatments                    |
| Mindfulness & Mental | Therapy & Counseling     | Individual Therapy, Group Counseling, Life Coaching |
|                      | Meditation & Relaxation  | Guided Meditation, Sound Bath, Breathing Exercises  |
| Medical & Holistic   | Chiropractic & Osteo     | Spinal Adjustment, Posture Correction               |
|                      | Physiotherapy            | Injury Rehabilitation, Post-Surgery Recovery        |
|                      | Nutrition & Diet         | Nutritional Counseling, Meal Prep, Diet Planning    |

**Custom sub-services:** SPs can add free-text sub-service labels per voucher service line (e.g. 'Peak Hours Unlimited' under Gym Access). These are member-facing display labels only. They attach to an existing Main Service and do not enter the global taxonomy. Host promotes taxonomy entries separately.

## 4. Data Model

### 4.1 Organization

#### Org Account

| Field                     | Type / Values           | Notes                                  |
|---------------------------|-------------------------|----------------------------------------|
| ID                        | UUID                    |                                        |
| Name                      | String                  |                                        |
| Logo                      | Image URL               |                                        |
| Registration No.          | String                  |                                        |
| Industry / Sub-industry   | Enum                    |                                        |
| Org Type                  | SME   Enterprise   NGO  |                                        |
| Financial Year Start Date | Date                    | Used as refresh_start_reference anchor |
| Subscription              | Plan / Billing / Status | Active, Pending, Suspended             |

#### Org Branch

| Field         | Type / Values                                    | Notes                 |
|---------------|--------------------------------------------------|-----------------------|
| ID            | UUID                                             |                       |
| Name          | String                                           |                       |
| Type          | HQ   Branch Office                               |                       |
| Address       | Line / City / State / Country / Postal / Lat-Lon |                       |
| Timezone      | String                                           |                       |
| PIC List      | Name / Email / Contact                           | Multiple allowed      |
| Branch Wallet | FK -> Org Branch Wallet                          | One wallet per branch |

#### Employee

| Field | Type / Values | Notes |
|-------|---------------|-------|
| ID    | UUID          |       |

|                           |                                               |                                           |
|---------------------------|-----------------------------------------------|-------------------------------------------|
| Join Date                 | Date                                          | Mandatory -- used for prorate calculation |
| Employee Code             | String                                        | HR-entered or auto-generated              |
| Corporate Email           | Email                                         | Used for magic link verification          |
| Probation End Date        | Date                                          | Required for Full-time type               |
| Employment Type           | Full-time   Part-time   Contract   Internship |                                           |
| Start & Termination Dates | Date range                                    | Controls benefit entitlement window       |

### Dependent

Child entity of Employee. Relationship types: spouse, child, mother, father, brother, sister, mother-in-law, father-in-law.

## 4.2 Benefit Configuration

### Policy

Policies are **created and owned by Host Admin**. HR cannot create policies — they assign pre-built policies to employees. Host can clone any policy to create variations. Host can see all policies across all orgs from a single view.

| Field                           | Values                  | Notes                                         |
|---------------------------------|-------------------------|-----------------------------------------------|
| code                            | Policy number           | Auto-generated                                |
| name                            | String                  | e.g. 'Standard Corporate Wellness 2026'       |
| created_by                      | FK -> Host Admin        | Policies are Host-owned. HR cannot create.    |
| cloned_from                     | FK -> Policy (optional) | Tracks lineage when cloned. Null if original. |
| assigned_orgs                   | FK list -> Org Accounts | One policy can be assigned to multiple orgs.  |
| eligible_roles / employee_types | Filterable multi-select |                                               |
| benefit_pool_type               | See Pool Type Matrix    |                                               |

|                         |                                                             |                                                                                  |
|-------------------------|-------------------------------------------------------------|----------------------------------------------------------------------------------|
| utilization_mode        | Fixed   Prorated                                            | See Utilization Matrix                                                           |
| refresh_cycle           | Daily / Weekly / Monthly / Quarterly / Yearly               | Valid cycles depend on utilization_mode                                          |
| refresh_start_reference | Org Financial Year Start   Employee Join Date   Custom Date | Custom Date: KIV                                                                 |
| activation_mode         | After Join Date   After Probation Ends   Custom Date        | Controls when employee becomes eligible. Replaces Claim Period. Custom Date: KIV |
| status                  | draft   active                                              |                                                                                  |

**Portal surface difference:** Host sees: create / edit / clone / assign policy to orgs. HR sees: list of policies assigned to their org + employee assignment wizard. HR cannot edit policy contents -- they manage who is on each policy only.

### Benefit Pool Type Matrix

| Employee Pool | Dependent Pool | Description                                                         |
|---------------|----------------|---------------------------------------------------------------------|
| Individual    | Individual     | Each employee has own pool; each dependent has own separate pool.   |
| Individual    | Shared         | Each employee has own pool; all dependents share one combined pool. |
| Shared        | --             | Employee + all dependents share a single combined pool.             |

### Utilization Mode + Refresh Cycle Matrix

**UI Note:** Compound field -- Host UI must enforce valid combinations. Fixed mode hides proration unit. HR cannot modify these settings -- set at policy creation by Host.

| Mode     | Prorate Unit | Valid Refresh Cycles                          |
|----------|--------------|-----------------------------------------------|
| Fixed    | --           | Daily / Weekly / Monthly / Quarterly / Yearly |
| Prorated | Daily        | Weekly / Monthly / Quarterly / Yearly         |
| Prorated | Weekly       | Monthly / Quarterly / Yearly                  |
| Prorated | Monthly      | Quarterly / Yearly                            |
| Prorated | Quarterly    | Yearly                                        |

## Benefit Group

Groups live inside a Policy. Each Group represents a **wellness category budget** (e.g. Fitness RM 2,000 / year).

| Field                   | Values                                    | Notes                                                                                          |
|-------------------------|-------------------------------------------|------------------------------------------------------------------------------------------------|
| group_id                | UUID                                      |                                                                                                |
| policy_id               | FK -> Policy                              |                                                                                                |
| name                    | String                                    | e.g. Fitness, Mental Health, Massage                                                           |
| group_distribution_type | Shared Amount   Individual Benefit Amount | Shared = one pool for all services in the group. Individual = each service has its own amount. |
| maximum_usage_per_cycle | Integer (optional)                        | Caps usage count regardless of remaining balance.                                              |

## Benefit (Allowlist Entry)

A Benefit is an **explicit allowlist entry** — one record per service that is covered under a Benefit Group. If a service is not listed as a Benefit, it **cannot be claimed**, regardless of whether it appears in the taxonomy. HR selects from the full service list when configuring a Group. Every ticked service becomes one Benefit record.

| Field                       | Values                        | Notes                                                                                |
|-----------------------------|-------------------------------|--------------------------------------------------------------------------------------|
| benefit_id                  | UUID                          |                                                                                      |
| group_id                    | FK -> Benefit Group           |                                                                                      |
| service_id                  | FK -> Taxonomy Main Service   | Explicit inclusion -- unlisted services cannot be claimed                            |
| benefit_amount / unit_value | RM amount                     | Amount coverable per service. Co-pay = package_price - benefit_amount (if positive). |
| co_payment_required         | Boolean                       |                                                                                      |
| co_payment_value            | Percentage or fixed RM amount |                                                                                      |

## Policy Worked Example

**Example Policy: Standard Corporate Wellness 2026** Assigned to: Acme Corp, TechStartup Sdn Bhd. Cloned from: Basic Corporate Wellness 2025.

| Benefit Group      | Budget / Cycle  | Distribution           | Covered Services (Allowlist)                                         |
|--------------------|-----------------|------------------------|----------------------------------------------------------------------|
| Fitness            | RM 2,000 / year | Shared pool            | Gym Access, Fitness Classes, Personal Training                       |
| Mental Health      | RM 1,000 / year | Individual per service | Therapy & Counseling (RM 800 + RM 200 co-pay), Meditation (RM 1,000) |
| Massage & Bodywork | RM 600 / year   | Shared pool            | Traditional / Relaxation, Therapeutic Massage                        |

Reading this: an employee on this policy gets RM 2,000 to spend across any Gym Access, Fitness Classes, or Personal Training vouchers. The pool is shared -- using it on gym reduces what's left for classes. Mental Health is individual per service: the therapy budget (RM 800 covered, RM 200 co-pay) is tracked separately from the meditation budget. Massage uses a shared pool across both covered service types.

## Benefit Assignment

Created when HR assigns a policy to an employee via the stepper wizard. HR sees only policies already assigned to their org by Host.

| Field                   | Values          | Notes                                                           |
|-------------------------|-----------------|-----------------------------------------------------------------|
| assignment_id           | UUID            |                                                                 |
| employee_id             | FK -> Employee  |                                                                 |
| policy_id               | FK -> Policy    | Must be a policy already assigned to the employee's org by Host |
| effective_start_date    | Date            |                                                                 |
| effective_end_date      | Date (optional) | null = recurring auto-renewal                                   |
| calculated_benefit_pool | RM amount       | Initial amount based on policy settings                         |
| prorated_factor         | Decimal         | Auto-computed based on join date + refresh cycle                |
| last_refresh_date       | Date            | Tracks cycle refresh timestamp                                  |

**Architecture Note:** Benefit Assignment is the most load-bearing entity. It sits between Host-configured policy and member experience. Prorate + refresh cycle + pool type must be unambiguous here before EPIC 05 design starts -- every 'remaining balance' display derives from this record.

## 4.3 Service Providers

### SP Account

| Field                 | Type / Values                  | Notes                                                                                                             |
|-----------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------|
| ID                    | UUID                           |                                                                                                                   |
| Name                  | String                         |                                                                                                                   |
| Registration No.      | String                         |                                                                                                                   |
| Service Categories    | Multi-select from Taxonomy     |                                                                                                                   |
| Description / Website | Text / URL                     |                                                                                                                   |
| Is Active             | Boolean                        | Toggled by Host Admin                                                                                             |
| PIC Details           | Name / Email / Contact         |                                                                                                                   |
| T&C                   | Text / document                | KIV: self-serve or Host-approved                                                                                  |
| is_tax_registered     | Boolean                        | Whether SP is registered for Service Tax (SST). Drives de-calculation on all transactions.                        |
| tax_reg_no            | String (optional)              | SP SST registration number. Required if is_tax_registered = TRUE. Printed on all tax documents.                   |
| tax_rate              | Decimal (default: 0.08)        | Defaults to 8% per Malaysia SST (March 2024). Editable for future-proofing. Ignored if is_tax_registered = FALSE. |
| Commission Schema     | Rate table by service category | Configured per SP by Host Admin. See Section 4.4.                                                                 |

**Malaysia SST Context:** Wellness centres, health centres, and massage parlours are explicitly listed under SST Group C at 8% (effective March 2024, expanded July 2025 to include beauty and aesthetic services). Registration is mandatory above RM 500,000 taxable turnover in 12 months. Not all SPs will qualify -- the toggle reflects legal reality, not preference.

## SP Branch

| Field             | Type / Values                                | Notes                 |
|-------------------|----------------------------------------------|-----------------------|
| ID                | UUID                                         |                       |
| Name              | String                                       |                       |
| Services          | Multi-select from SP Account categories      |                       |
| Address + Lat/Lon | Google Maps compatible                       | KIV: Map SDK provider |
| Operating Hours   | Per-day config incl. public holiday override |                       |
| Facilities        | Free text                                    |                       |
| Rating            | Float (optional)                             | Phase 2               |
| Is Active         | Boolean                                      |                       |

## SP Voucher

SP sets one final\_price for the whole voucher. Each included service line maps to a **Main Service** from the taxonomy (commission is calculated at this level) and carries a **weight** (proportional, summing to 1.0). SP can add custom sub-service descriptions per line — these are free-form labels for what's delivered, not taxonomy entries. The backend uses the Main Service mapping for commission, not the sub-service description.

| Field             | Type / Values                                  | Notes                                                                                                                                                                                                                   |
|-------------------|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| code              | PAC{SPID}0001                                  | Auto-generated                                                                                                                                                                                                          |
| name              | String                                         |                                                                                                                                                                                                                         |
| description       | Long text                                      |                                                                                                                                                                                                                         |
| included_services | Itemized list                                  | Each item: main_service_id (FK -> Taxonomy Main Service) + custom_sub_service_label (free text, optional) + duration (unit: session/min/hr/day/month/year; value: 1-n) + weight (decimal, all weights must sum to 1.0). |
| status            | Draft   Published   Activated   Paused   Ended |                                                                                                                                                                                                                         |

|                   |                                                  |                                                                                                                                 |
|-------------------|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| activation_period | Start date + optional end date                   | When voucher is available for purchase on marketplace. No end date = listed indefinitely.                                       |
| currency          | MYR (v1)                                         |                                                                                                                                 |
| initial_price     | RM (no decimal)                                  | Pre-discount display price                                                                                                      |
| final_price       | RM (no decimal)                                  | Round up $\geq 0.5$ , down $< 0.5$ . Gross Amount (SST-inclusive if SP is tax-registered). This is the single transacted price. |
| redemption_period | On Exact Date   After Purchase Date + unit/value | How long a purchased voucher is valid after purchase                                                                            |
| branches          | ALL or specific branch list                      |                                                                                                                                 |

**Custom sub-services:** SPs can describe what they deliver in their own words per service line (e.g. '60-min deep tissue + hot stone add-on'). This label is for member display only. Commission is calculated from the main\_service\_id FK, not the label. Custom sub-service labels do not enter the global taxonomy -- Host promotes taxonomy entries separately.

**Weight model:** SP sets weights not prices per line (e.g. 0.6 / 0.4). Commission formula: final\_price x weight x main\_service\_category\_commission\_rate per line. Weights validated to sum to 1.0 before voucher can be published. SP never does commission math.

**Assisted creation:** Host Admin can create and edit SP vouchers on behalf of an SP for support purposes. JTBD ownership is with the SP -- Host assistance is an exception, not the primary flow.

## 4.4 Commission Schema (Service-Category Level)

Commission is configured **per SP, per service category** by Host Admin -- not a single global rate. This allows commercial flexibility: Fitness category might attract 12%, while Mental Health commands 20%.

| Field            | Values                  | Notes                                                                                                    |
|------------------|-------------------------|----------------------------------------------------------------------------------------------------------|
| sp_id            | FK -> SP Account        | One schema per SP                                                                                        |
| service_category | FK -> Taxonomy Category | Top-level category (e.g. Fitness & Exercise). Commission is applied at category level, calculated on the |

|                         |                       |                                                             |
|-------------------------|-----------------------|-------------------------------------------------------------|
|                         |                       | Main Service line's proportional share.                     |
| commission_rate         | Decimal (0.10 - 0.30) | Applies to redeemed vouchers                                |
| expired_commission_rate | Decimal (0.10 - 0.30) | Applies to expired vouchers. Can differ from redeemed rate. |
| effective_from          | Date                  | Allows future-dated rate changes                            |

### Commission Calculation on Multi-Service Vouchers

**Formula:**  $\text{total\_commission} = \text{SUM}(\text{final\_price} \times \text{weight} \times \text{category\_commission\_rate})$  per service line

**Net SP payout:**  $\text{final\_price} - \text{total\_commission}$

**Example:** Voucher at RM 200 final price, two services:

Gym Access (weight 0.6, Fitness category 12%):  $\text{RM } 200 \times 0.6 \times 0.12 = \text{RM } 14.40$

Therapy (weight 0.4, Mental Health category 20%):  $\text{RM } 200 \times 0.4 \times 0.20 = \text{RM } 16.00$

Total commission: RM 30.40 | Net SP payout: RM 169.60

**KIV -- Commission Basis:** Not yet confirmed whether Welluber commission is calculated on Gross Amount (SST-inclusive) or Net Amount (ex-SST). Must be resolved with auditor before settlement math is finalized. Examples above use Gross as working assumption.

## 4.5 Finance & Settlement

### Org Branch Wallet

| Attribute     | Values                                                           | Notes                                                  |
|---------------|------------------------------------------------------------------|--------------------------------------------------------|
| Model         | Cash Balance   Credit Limit                                      | Cash = pre-funded; Credit = billed on cycle            |
| Scope         | Per branch                                                       | One wallet per Org Branch                              |
| Top-up        | Via Payment Gateway                                              | Balance credited on payment success                    |
| Blocking Rule | wallet balance < employee policy entitlement -> purchase blocked | Forces HR to top up. Ensures full benefit utilization. |

**KIV -- Wallet Model Definition Required:** Current model: one wallet per Org Branch. If a Main + Add-on wallet concept is needed (e.g. primary budget + supplementary top-up), the wallet data model must be redefined before this section can be finalized. Explicitly deferred -- do not design around assumptions.

## SP Settlement Ledger

| Attribute               | Values                                                         | Notes                                                    |
|-------------------------|----------------------------------------------------------------|----------------------------------------------------------|
| Model                   | Ledger-only -- no pre-funded balance                           | Every redeemed or expired claim generates a ledger entry |
| Settlement Cycle        | Monthly (assumed)                                              | KIV: Weekly / Monthly / On-demand Host trigger           |
| Net SP Payout           | final_price - total_commission (weighted calc per Section 4.4) |                                                          |
| Net SP Payout (Expired) | Per Host-configured expired voucher split                      | Must sum to 100%: Org refund + SP + Welluber             |
| Co-pay (Walk-in)        | Excluded from settlement                                       | SP collected co-pay physically                           |
| Walk-in Edge Case       | If co-pay > Welluber commission -> SP owes difference          | Offset against future payouts                            |

## 5. Tax & Compliance

This section covers Service Tax (SST) handling for Malaysian operations. The design principle: **Welluber automates all tax paperwork. Neither HR nor SP should need to manually calculate, compile, or chase tax documents.**

**KIV -- Auditor Review Required:** The tax model below is a working design based on Malaysia SST regulations (effective March 2024 / July 2025). Critical open question pending auditor sign-off: Is Welluber the taxable person (marketplace operator collecting SST) or is the SP the taxable person (SP charges SST, Welluber remits)? This determines the invoice chain and whether Welluber's own commission is subject to SST separately. Do not finalize or build this section until auditor confirms.

### 5.1 Display Rule

**All prices in the Member App are SST-inclusive (Gross) by default.** Gross Amount is the anchor -- it is what the member sees, what is deducted from the wallet, and what all downstream calculations derive from.

### 5.2 Tax Toggle -- SP Profile

| Toggle State              | Behaviour                                                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_tax_registered = TRUE  | SP is SST-registered. System de-calculates SST from Gross on every transaction. $\text{Net} = \text{Gross} / 1.08$   $\text{SST Component} = \text{Gross} - \text{Net}$ |
| is_tax_registered = FALSE | SP not SST-registered (below RM 500K threshold or exempt). No de-calculation. $\text{Net} = \text{Gross}$   $\text{SST Component} = \text{RM } 0.00$                    |

#### De-calculation Example (tax\_rate = 8%)

| Field                   | SST-Registered SP        | Non-Registered SP |
|-------------------------|--------------------------|-------------------|
| Gross (displayed price) | RM 1,075.00              | RM 1,075.00       |
| Net (base price)        | RM 995.37 (Gross / 1.08) | RM 1,075.00       |
| SST Component (8%)      | RM 79.63                 | RM 0.00           |

### 5.3 Three-Way Settlement Document Chain

Welluber handles all tax document generation automatically. Zero manual effort from HR or SP.

| Flow                        | Document                      | Contents                                                                                                                                   |
|-----------------------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Employee redeems voucher    | Transaction Receipt           | Gross, Net, SST component, vendor name, SST registration no. (if applicable)                                                               |
| Welluber -> HR (monthly)    | Consolidated Tax Invoice      | Sum of all Net amounts + total SST for the month. HR pays or deducts once. Ready to file.                                                  |
| Welluber -> SP (settlement) | Payment Advice + Tax Document | Gross - Commission = net payout, itemized per voucher. System pre-fills tax document using SP tax_reg_no. SP reviews and one-tap approves. |

**KIV -- SP Tax Invoice Workflow:** Settlement requires SP to issue a Tax Invoice to Welluber. Options: (A) Welluber auto-generates this on SP behalf using stored tax\_reg\_no -- SP one-tap approves. Reduces burden, Welluber takes document responsibility. (B) SP uploads manually -- simpler for Welluber, more burden on SP. Recommendation: Option A, pending auditor confirmation that Welluber can generate on SP behalf.

## 5.4 Monthly Utilization Report (HR / Finance)

Auto-generated monthly. Zero manual effort from HR Finance. Designed for RMCD filing readiness.

| Field                | Description                                  | Notes                         |
|----------------------|----------------------------------------------|-------------------------------|
| Transaction Date     | Date of redemption or claim                  |                               |
| Vendor Name          | SP name                                      |                               |
| SST Registration No. | SP tax_reg_no                                | Blank if not registered       |
| Gross Amount         | Amount deducted from wallet                  | What the member saw           |
| Net Amount           | Taxable base (Gross / 1.08)                  | RM 0 if SP not registered     |
| Tax Amount (8%)      | SST component (Gross - Net)                  | For HR tax records            |
| Benefit Group        | Which benefit group was used                 | e.g. Fitness, Mental Health   |
| Branch Entity        | Org branch owning the primary benefit policy | Tax liability attributed here |

**Audit Trail:** SST de-calculation inputs (Gross, tax\_rate, is\_tax\_registered at time of transaction) are stored immutably on the transaction record. 7-year retention per RMCD requirement. The calculated values cannot be altered after the transaction completes.

## 5.5 AI-Assisted Document Automation

---

- **Auto-generated monthly tax invoice:** System compiles all transactions, applies de-calculation, and produces a ready-to-file PDF for HR. Zero manual input.
- **Pre-filled SP tax document:** System generates Payment Advice and pre-fills the tax document template using SP stored tax\_reg\_no. SP one-tap approves rather than creating from scratch.
- **Anomaly detection:** If SST calculation produces unexpected result (e.g. tax flagged on non-registered SP), system flags it in the dashboard -- never silently passes it through.
- **Audit trail:** Every de-calculation stored with inputs at time of transaction. Immutable. RMCD-compliant.

## 6. Core User Flows

Flows are grouped into three categories: **Setup flows** (Host-operated, before the app works), **App flows** (user-facing transactions at runtime), and **Operational flows** (background and periodic). See `welluber_flows.md` for Mermaid diagrams of key flows.

**Approval & review flows:** Manual approval steps (org registration, SP registration) are trust-building mechanisms for early Welluber operations. As SP and org volume grows, these should move to self-serve verification with automated checks. For MVP: Host approves manually. Architecture must not couple tightly to these approval steps -- they should be removable without structural changes.

### SETUP FLOWS — Host-Operated

These flows run before any employee can transact. Host Admin is the primary actor in all setup flows.

#### Flow 1 — Host: Platform Configuration

**Actors:** Host Admin

**Trigger:** Platform launch, or global settings need updating

1. **[Host Admin] Configures global service taxonomy** -> Category -> Main Service -> Sub-service. This is the master list all SPs and policies reference.
2. **[Host Admin] Sets global cancellation window** -> Default: 3 hours. Applies to all unpaid Pending vouchers platform-wide.
3. **[Host Admin] Sets global voucher redemption period** -> Default: 15 days. Applies to all Active vouchers platform-wide.
4. **[Host Admin] Configures expired voucher payout split** -> % Org wallet refund + % SP ledger + % Welluber commission. Must sum to 100%. Applies globally unless overridden per SP.

#### Flow 2 — Setting Up an Organisation

**Primary actor:** Host Admin (v1). Org Admin takes over steps marked [Org Admin / Host Admin] in v2.

**Trigger:** New company is contracted to use Welluber

**End state:** Org Admin has portal access, branches configured, employees uploaded and reviewed, policy assigned, wallet created, invite emails queued for send

**v1 operating model:** In v1, Host Admin runs this flow end-to-end on behalf of the org. Steps marked [Org Admin / Host Admin] indicate the JTBD owner in v2 — Org Admin will self-serve these. Steps marked [Host Admin] are always Host-only regardless of version.

1. **[Host Admin] Creates org account** -> Enters: company name, registration no., industry, org type, financial year start date, subscription plan
2. **[Host Admin] Creates Org Branch(es)** -> HQ first, then additional branches. Per branch: name, type, address, lat/lon, timezone, PIC contact list (name, email, phone — contact record only, not a platform user)
3. **[Host Admin] Adds Org Admin user(s)** -> User Management -> Add User. Enters name + email. Role: Org Admin. This is separate from PIC — Org Admin gets portal login rights. Multiple admins allowed.
4. **[System] Sends invite link to each Org Admin email** -> Magic link — same mechanism as member identity linking. Link opens the Welluber Org portal, prompts account setup (name, password-free, Google/Apple SSO). Token expiry: 60 minutes.
5. **[Host Admin] Assigns one or more Policies to the org** -> Selects from active policies. Org Admin will see these in their assignment wizard. Can assign multiple policies for different employee groups.
6. **[Host Admin] Configures org subscription** -> Plan, billing model, start date
7. **[Host Admin / Org Admin] Creates Branch Wallet** -> Selects model: Cash Balance or Credit Limit. Wallet record created. Balance is zero at this point.
8. **[Host Admin] Sends payment link to Org Finance for wallet funding** -> Similar to Stripe payment link — Finance clicks, pays via gateway, balance credited immediately. Host Admin does not handle money directly.

## v2 handoff — Org Admin self-serves from here

9. **[Org Admin / Host Admin] Uploads employee list via CSV/Excel** -> Template provided. Row-level validation — error report per bad row. Partial upload of valid rows permitted.
10. **[Org Admin / Host Admin] Reviews uploaded employee list** -> Tick/untick employees before triggering invites. Prevents accidental mass-send on test uploads.
11. **[Org Admin / Host Admin] Triggers bulk invite to employees** -> System sends email to each employee: 'Your benefits are ready. Download Welluber and enter your Employee ID.'
12. **[Org Admin / Host Admin] Opens Policy Assignment wizard** -> Step 1: select policy. Step 2: select employees. Step 3: review pool amounts + confirm. Entitlements are derived from policy — no manual allocation.
13. **[Backend] Creates Benefit Assignments per employee** -> Auto-computes prorated\_factor per join date + activation\_mode + refresh cycle. Activation begins per policy settings.

## Edge Cases

- **Invite link expired (>60 min):** Org Admin can request a new link from Host Admin. Self-serve resend available in v2.
- **PIC ≠ Org Admin:** PIC is a contact record (displayed on branch profile). Org Admin is a platform user with login. They can be the same person — set up separately.
- **Wallet not funded:** Employees can be enrolled and invites sent. Transactions are blocked until wallet is funded. Dashboard shows clear blocked state.
- **Multiple policies:** Run the assignment wizard once per policy. Different employee groups can be on different policies.

## Flow 3 — Setting Up a Service Provider

**Primary actor:** Host Admin (v1). SP Admin takes over steps marked [SP Admin / Host Admin] in v2.

**Trigger:** New wellness centre is contracted to partner with Welluber

**End state:** SP Admin has portal access, branches configured, commission + tax profile set, ready to create vouchers

**v1 operating model:** In v1, Host Admin runs this flow end-to-end. SP Admin will self-serve steps marked [SP Admin / Host Admin] in v2. Steps marked [Host Admin] are always Host-only — commission schema and tax profile are never exposed to SP Admin.

1. **[Host Admin] Creates SP account** -> Enters: company name, registration no., service categories offered, description, website, PIC contact details
2. **[Host Admin] Configures commission schema for this SP** -> Rate table per service category (e.g. Fitness 12%, Mental Health 20%, Massage 15%). Per-SP rate — not global. Separate rates for redeemed vs expired vouchers.
3. **[Host Admin] Sets SP tax profile** -> is\_tax\_registered toggle + tax\_reg\_no + tax\_rate (default 8%). Drives SST de-calculation on all this SP's transactions. Never visible to SP Admin.
4. **[Host Admin] Adds SP Admin user(s)** -> User Management -> Add User. Enters name + email. Role: SP Admin. Multiple admins allowed. This is separate from PIC contact list.
5. **[System] Sends invite link to each SP Admin email** -> Magic link — opens Welluber SP portal, prompts account setup. Token expiry: 60 minutes.

### v2 handoff — SP Admin self-serves from here

6. **[SP Admin / Host Admin] Creates branch profile(s)** -> Per branch: name, address, lat/lon (map), operating hours (per-day config incl. public holiday override), facilities (free text), is\_active toggle
7. **[SP Admin / Host Admin] Creates vouchers** -> See Flow 7 for full voucher creation detail. Host Admin can create or edit any SP voucher in god-mode.

### Edge Cases

- **Commission schema not set:** SP vouchers cannot be published until Host Admin has configured a commission schema for the SP. System blocks publish with: 'Commission not configured. Contact Welluber.'
- **Tax profile not set:** Defaults to is\_tax\_registered = FALSE until Host Admin explicitly sets it. No SST de-calculation occurs. Audit trail records the flag state at time of each transaction.
- **PIC ≠ SP Admin:** PIC is a contact record shown on the branch public profile. SP Admin has portal login rights. Can be the same person — set up separately.
- **Multiple branches:** Run step 6 once per branch. Branches can have different service subsets from the SP's configured categories.

## Flow 4 — Host: Create and Manage Policies

**Actors:** Host Admin

**Trigger:** New policy needed, or existing policy needs updating or replication

1. **[Host Admin] Policy Management -> Create Policy** -> Sets: name, eligible roles/employee types, benefit pool type, utilization mode, refresh cycle, activation mode
2. **[Host Admin] Adds Benefit Groups** -> Each group = a wellness category budget. Name, distribution type (Shared or Individual), max usage per cycle (optional)
3. **[Host Admin] Adds Benefits (allowlist) to each Group** -> Explicitly selects from taxonomy Main Service list. Each ticked service = one Benefit record. Commission and eligibility validated against this list at claim time.
4. **[Host Admin] Sets co-pay per Benefit if applicable** -> Fixed RM amount or percentage. Boolean flag if co-pay is required.
5. **[Host Admin] Saves as draft -> reviews -> activates** -> Draft = not visible to HR. Active = available for org assignment.
6. **[Host Admin] Assigns policy to one or more orgs** -> One policy can be shared across multiple orgs. HR sees it in their assignment wizard immediately.
7. **[Host Admin] Optionally: Clone an existing policy** -> Copies full structure (groups + benefits). Rename + adjust. cloned\_from lineage tracked. Useful for annual policy refreshes.

**Policy is read-only for HR:** HR can view policy contents in the assignment wizard but cannot edit. All policy changes go through Host Admin. This ensures consistency across orgs sharing the same policy.

## APP FLOWS — User-Facing Transactions

These flows run at runtime. The platform must be fully set up (Flows 1-4) before these work.

### Flow 5 — Member: Account Activation & Corporate Identity Linking

**PITCH MOMENT** Pitch Moment #1: New employee, app install to active benefit wallet in under 5 minutes. Two-inbox security makes it feel seamless and trustworthy.

**Actors:** Member, Backend, HR (upstream — employee list already uploaded)

**Trigger:** Employee downloads Welluber app for the first time

1. **[Member] Opens app -> Welcome screen** -> Marketplace visible, benefits locked
2. **[Member] Taps 'Create Account'** -> Personal Email / Google SSO / Apple SSO
3. **[Backend] Creates Welluber root account** -> Personal identity established. No corporate link yet.
4. **[Member] App home — Browse mode** -> Benefit wallet locked. CTA: 'Add Corporate Identity'
5. **[Member] Taps 'Add Corporate Identity'** -> enters Employee ID or Corporate Email
6. **[Backend] Cross-references against HR's uploaded employee list**  
 IF Employee found

**YES** -> Proceed to step 7

**NO** -> MEMBER\_NOT\_FOUND -> 'Check your Employee ID or contact HR'

7. **[Backend] Sends magic link to corporate email (not personal)** -> Token expiry: 60 minutes
8. **[Member] Opens corporate inbox -> taps magic link** -> Universal link — opens app directly, never browser
9. **[Backend] Validates token -> binds corporate identity to Welluber account**
10. **[App] Routes to Benefit Wallet screen** -> Benefit groups visible, pool amounts shown, checkout unlocked

### Edge Cases

- **Token expired (>60 min):** 'Link expired' with Resend CTA. Pending identity not invalidated — re-issue token only.
- **Browser fallback:** Branded page with 'Open in Welluber App' deep link. Binding must not complete in browser.
- **Multiple corporate identities:** Profile -> Corporate Identities -> Add New. Available at any time post-onboarding.

## Flow 6 — Org Admin: Ongoing Employee & Benefit Management

**PITCH MOMENT** Pitch Moment #2: Org Admin sees every employee's benefit status, assigns policies in 3 steps, and triggers wallet top-up — all without leaving one screen. No spreadsheets, no back-and-forth.

**Actors:** Org Admin / Host Admin

**Trigger:** New employees added, policy changes needed, or wallet requires attention

**Pre-condition:** Org account set up (Flow 2). At least one policy assigned to org by Host Admin.

### Adding new employees

1. **[Org Admin / Host Admin] Employee Management -> Upload CSV or add individually** -> Row-level validation. Error report per bad row. Partial upload permitted.
2. **[Org Admin / Host Admin] Reviews employee list — tick/untick before sending invites** -> Prevents accidental mass-send. Can filter by branch, employment type.
3. **[Org Admin / Host Admin] Triggers bulk invite** -> System emails each employee: 'Your benefits are ready. Download Welluber and enter your Employee ID.'

### Assigning a policy to employees

4. **[Org Admin / Host Admin] Policy Assignment wizard -> Step 1: Select policy** -> Only policies Host has assigned to this org are shown. Policy contents (groups, benefits, amounts) shown read-only.
5. **[Org Admin / Host Admin] Step 2: Select employees** -> Filter by branch, employment type, role. Individual or bulk.
6. **[Backend] Auto-computes prorated\_factor per employee** -> Based on join date + policy activation\_mode + refresh cycle

**7. [Org Admin / Host Admin] Step 3: Review assignment summary** -> Shows: employee count, effective start dates, estimated pool amounts. Entitlements derived from policy — no manual amount entry.

**8. [Org Admin / Host Admin] Confirms assignment** -> Benefit Assignments created. Activation begins per each employee's activation\_mode.

### Wallet top-up

**9. [Org Admin / Host Admin] Wallet Management -> Branch Wallet -> view balance + pending deductions**

**10. [Org Admin / Host Admin] Initiates top-up** -> Option A: pay directly via Payment Gateway now. Option B: Host Admin sends payment link to Org Finance — Finance clicks and pays independently.

**IF** Payment success

**YES** -> Balance credited immediately. Any blocked employee purchases unblocked.

**NO** -> Payment failed -> retry or switch payment method

### Edge Cases

- **No policies assigned by Host:** Wizard shows empty state: 'No policies available. Contact your Welluber account manager.'
- **Employee on probation:** activation\_mode = After Probation Ends -> assignment queued, activates automatically on probation\_end\_date. Shown as 'Pending activation' in wizard.
- **Manual pool refresh:** Utilization dashboard -> select employee(s) -> Refresh Pool. Does not reset cron schedule. Triggers immediate recalculation.
- **Multiple policies:** Run the wizard once per policy. Different employee groups can be on different policies simultaneously.

## Flow 7 — SP: Voucher Creation & Lifecycle

---

**Actors:** SP Admin (primary), Host Admin (assisted override)

**Trigger:** SP wants to list a new wellness voucher on the marketplace

**1. [SP Admin] Voucher Catalog -> Create Voucher**

**2. [SP Admin] Adds included service lines** -> Per line: selects Main Service from taxonomy + optional custom sub-service label (free text) + duration + weight

**3. [System] Validates: all weights sum to 1.0** -> Inline validation. Cannot proceed to pricing if invalid.

**4. [SP Admin] Sets final\_price (Gross, SST-inclusive)** -> Single price for the whole voucher. System handles commission split and SST de-calc in the background.

**5. [SP Admin] Sets activation period** -> Start date (mandatory) + optional end date. No end date = listed indefinitely.

**6. [SP Admin] Sets redemption period** -> On Exact Date OR After Purchase Date (unit: hr/day/month + value)

**7. [SP Admin] Selects applicable branches** -> ALL or specific branch list

**8. [SP Admin] Saves as Draft -> Publishes** -> Published = visible to marketplace when activation period starts

## Voucher Status Machine

Draft -> Published -> Activated -> Paused -> Ended

- **Draft:** Editing in progress. Not visible on marketplace.
- **Published:** Ready. Appears on marketplace when activation\_period start date is reached.
- **Activated:** Activation period live. Package is transactable.
- **Paused:** SP temporarily hides. Can resume.
- **Ended:** Activation end date passed. No new purchases. Existing vouchers valid through their redemption period.

**Activation period vs redemption period:** activation\_period = when the package is listed and purchasable on the marketplace. redemption\_period = how long a purchased voucher remains valid after purchase. Both must be configured separately. Both must appear in the package creation UI.

## Flow 8 — Member: Online Voucher Purchase (Scenario A)

**PITCH MOMENT** Pitch Moment #3: Employee finds a gym voucher, checks out cashlessly, receives an active voucher in under 60 seconds. This is the core member experience.

**Actors:** Member, Backend, Payment Gateway

**Trigger:** Member browses marketplace and selects a voucher to purchase

1. **[Member] Browses marketplace — filters by category / location / price** -> All prices SST-inclusive (Gross)
2. **[Member] Selects voucher -> views detail** -> Final price, included services, redemption period, co-pay amount if applicable
3. **[Member] Taps 'Purchase'**
4. **[Backend] Validates: Member benefit is active (activation\_mode check)**
  - IF Not yet active
  - YES -> BENEFIT\_NOT\_ACTIVATED** -> 'Your benefits haven't started yet. Check with HR.'
  - NO -> Continue**
5. **[Backend] Validates: Member benefit pool sufficient for this service**
  - IF Exhausted
  - YES -> BENEFIT\_POOL\_EXHAUSTED** -> 'No remaining balance for this service.'
  - NO -> Continue**
6. **[Backend] Validates: Org wallet balance >= employee policy entitlement**
  - IF Insufficient
  - YES -> ORG\_WALLET\_INSUFFICIENT** -> 'Insufficient company funds. Contact HR.'
  - NO -> Continue**
7. **[Backend] Creates Pending voucher — reserves balance** -> 3-hour cancellation window starts

**8. [Member] Pays co-pay via Welluber Payment Gateway (if applicable)** -> If no co-pay: system deducts covered amount only

**9. [Backend] Payment confirmed -> Voucher Active** -> Deducts covered amount from Org wallet + Member benefit pool

**10. [Backend] If SP is\_tax\_registered: de-calculates SST from Gross** -> Stores Net + SST component immutably on transaction record

**11. [Member] Receives Active voucher with TOTP voucher code** -> Redemption period countdown starts

## Voucher States

| State     | Description                                         | UI Treatment                                    |
|-----------|-----------------------------------------------------|-------------------------------------------------|
| Pending   | Payment initiated, not confirmed. 3-hour window.    | Pending indicator + countdown timer             |
| Active    | Confirmed. Voucher valid. Redemption timer running. | TOTP voucher code + redemption period countdown |
| Presented | Code shown to SP. Awaiting SP confirmation.         | 'Presented at SP' status indicator              |
| Redeemed  | SP confirmed. Service delivered.                    | Completed — greyed with timestamp               |
| Expired   | Redemption period lapsed. Payout split triggered.   | Expired badge — shows split breakdown           |
| Cancelled | Unpaid Pending auto-cancelled after 3 hours.        | Cancelled — option to re-purchase               |

## Path B — Voucher Expiry

- 1. [Cron] Redemption period lapses -> Voucher: Active -> Expired**
- 2. [Backend] Reads expired\_voucher\_policy from Host config** -> % Org refund + % SP ledger + % Welluber. Must sum to 100%.
- 3. [Backend] Generates ledger entries per configured split**
- 4. [Member] Push notification: 'Your voucher has expired'**

## Flow 9 — SP: Voucher Redemption (Online-Purchased Voucher)

**Actors:** Member, SP Staff, Backend

**Trigger:** Member arrives at SP with an Active voucher

- 1. [Member] Opens app -> navigates to Active voucher -> shows TOTP code to SP staff ->**  
Code refreshes periodically

2. **[SP Staff] Enters voucher code in SP portal** -> v1: code entry, not QR scan — reliable, offline-compatible

IF Code invalid or expired

YES -> Error: 'Invalid code — ask member to refresh their screen'

NO -> Continue

3. **[Backend] Validates: code is valid, voucher is Active, SP matches**

4. **[Backend] Voucher: Active -> Presented -> Redeemed** -> Weighted commission calculated per service line. Ledger entry created.

5. **[SP Portal] Confirmation screen: member name, service, settlement reference**

6. **[Member App] Voucher -> Redeemed. Push notification: 'Voucher redeemed at [SP Name]'**

## Flow 10 — SP: Walk-in Claim (Scenario B)

**PITCH MOMENT** Pitch Moment #4: SP staff completes a walk-in claim in 3 taps — lookup to confirmation — without the employee touching their phone.

**Actors:** SP Staff, Member (present physically), Backend

**Trigger:** Employee walks into SP without a pre-purchased voucher

1. **[SP Staff] Opens Member Lookup in SP portal**

2. **[SP Staff] Identifies member — layered approach in priority order:**

1. **QR scan (fast path):** Member opens digital ID card in app -> SP scans -> unambiguous identity

2. **Employee ID (fallback):** Member provides Employee ID verbally or on paper

3. **Name search (last resort):** Returns disambiguation display when above options unavailable

3. **[Backend] Returns filtered results** -> Active employees with activated benefits and sufficient pool only. Never returns departed or benefit-not-yet-activated identities.

4. **[SP Staff] Confirms correct member (disambiguation if name collision)** -> Shows: org name, branch, partial Employee ID

5. **[Backend] Collision check: Active voucher exists for same Main Service?**

IF Collision found

YES -> ACTIVE\_VOUCHER\_EXISTS: 'Member has an active voucher — ask them to present it.' Walk-in blocked.

NO -> Continue

6. **[SP Staff] Selects service from SP voucher catalog**

7. **[Backend] Validates: benefit activation + pool + org wallet** -> Returns structured error code on failure

8. **[SP Staff] Reviews pre-filled claim summary** -> Covered amount, co-pay amount, member name, selected service

9. **[SP Staff] Taps 'Submit Claim'** -> No member app approval required

**10. [Backend] Auto-deducts Org wallet + Member benefit pool** -> De-calculates SST if SP is\_tax\_registered. Ledger entry created.

**11. [SP Portal] Co-pay prompt if applicable** -> 'Collect RM [X] directly from customer'

## Error Codes

BENEFIT\_NOT\_ACTIVATED -> 'This member's benefits haven't started yet. Check with HR.'

BENEFIT\_POOL\_EXHAUSTED -> 'This member has no remaining balance for this service.'

MEMBER\_NOT\_FOUND -> 'No active member found. Ask them to check their account.'

ORG\_WALLET\_INSUFFICIENT -> 'Organisation wallet has insufficient funds. Contact HR.'

ACTIVE\_VOUCHER\_EXISTS -> 'Member has an active voucher. Ask them to present it.'

## Flow 11 — HR: Wallet Top-Up

---

**Actors:** HR Finance, Payment Gateway

**Trigger:** Wallet balance low, blocked, or scheduled top-up

- [HR Finance] Wallet Management -> Branch Wallet -> view current balance, pending deductions**
- [HR Finance] Initiates top-up -> enters amount -> redirected to Payment Gateway**
  - IF** Payment success
    - YES** -> Balance credited immediately. Dashboard updates. Any blocked employee purchases unblocked.
    - NO** -> Payment failed -> error state -> retry or use alternative method
- [HR Admin] Receives confirmation notification + updated balance**

## Flow 12 — Host/SP: Settlement & Payout

---

**PITCH MOMENT** Pitch Moment #5: Host Admin god-mode — platform-wide settlement view, one trigger, every SP paid correctly. Welluber is infrastructure, not just an app.

**Actors:** Host Admin, Backend, SP Admin

**Trigger:** Monthly settlement cycle reached, or Host triggers on-demand payout

- [Backend] Aggregates all ledger entries since last settlement per SP** -> Redeemed vouchers + expired voucher splits
- [Backend] Calculates net payout per SP using weighted commission formula** -> Walk-in co-pay excluded. SST de-calculation applied per SP flag.
- [Backend] Auto-generates settlement statement + pre-filled tax document per SP** -> Uses stored tax\_reg\_no. No manual input from SP.
- [SP Admin] Reviews statement in SP portal + one-tap approves tax document**

5. **[Host Admin] Reviews platform-wide settlement report** -> Filter by SP, date range, status
6. **[Host Admin] Triggers payout to SPs** -> Manual trigger for MVP. Auto-cycle TBD.

### Settlement Math Examples

| Scenario                         | Gross         | Commission  | Net SP Payout | SST (if registered) |
|----------------------------------|---------------|-------------|---------------|---------------------|
| Online — single service, 15%     | RM 100        | RM 15       | RM 85         | RM 7.41             |
| Online — multi-service, weighted | RM 200        | RM 30.40    | RM 169.60     | RM 14.81            |
| Walk-in, RM 20 co-pay            | RM 80 covered | RM 12       | RM 68         | Per SP flag         |
| Expired (50/40/10 split)         | RM 100        | RM 10 (10%) | RM 40 (40%)   | Per SP flag         |

## OPERATIONAL FLOWS — Background & Periodic

These flows run automatically or on-demand. No user action required unless noted.

### Flow 13 — Policy Engine: Pool Refresh & Proration

**Actors:** Backend (cron), HR (optional manual trigger)

**Trigger:** Refresh cycle date reached per Policy config, or HR manually triggers

1. **[Cron / HR] Triggers pool refresh for all active Benefit Assignments under policies with refresh\_cycle due** -> HR can also trigger manually per employee or full cohort from utilization dashboard
2. **[Backend] Reads refresh\_start\_reference per policy** -> Org Financial Year Start | Employee Join Date | Custom Date (KIV)
3. **[Backend] Computes prorated\_factor if utilization\_mode = Prorated** ->  $\text{prorated\_factor} = \text{days\_remaining\_in\_cycle} / \text{total\_days\_in\_cycle}$
4. **[Backend] Recalculates pool: Fixed = full amount. Prorated = full\_amount x prorated\_factor**
5. **[Backend] Updates calculated\_benefit\_pool + last\_refresh\_date on each assignment**
6. **[Member App] Balance display refreshes on next app open**

### Flow 14 — HR: Utilization Dashboard & Reporting

**Actors:** HR Admin, HR Finance, Manager

**Trigger:** HR needs to track spend, identify low utilization, or export reports

1. **[HR Admin] Opens Utilization Dashboard — real-time view**
2. **[HR Admin] Views aggregate metrics** -> Total spend to date, wallet balance, utilization % by benefit group
3. **[HR Admin] Drills into employee-level view** -> Per employee: group balances, vouchers purchased, claims, last activity
4. **[HR Admin] Filters by branch / policy / date range / service category**
5. **[HR Finance] Downloads Monthly Utilization Report** -> Gross, Net, SST breakdown per transaction. Auto-generated.
6. **[HR Finance] Downloads Consolidated Tax Invoice** -> Monthly SST summary. Ready-to-file for RMCD.

### Dashboard Widgets (MVP)

- Wallet balance per branch — current balance, % consumed this cycle
- Utilization by benefit group — RM spent / RM allocated
- Top services redeemed — ranked by transaction count
- Active employees with zero utilization — prompt for re-engagement
- Pending / active / expired voucher count

## Flow 15 — HR: Employee Offboarding

---

**Actors:** HR Admin, Backend

**Trigger:** Employee leaves or is terminated

1. **[HR Admin] Employee Management** -> selects employee -> **Deactivate**
  2. **[HR Admin] Confirms deactivation. Optional: enters termination date.**
  3. **[Backend] Corporate identity: Active -> Deactivated**
  4. **[Backend] All Active vouchers for this org expire immediately** -> Default — no grace window in MVP
  5. **[Backend] Triggers expired\_voucher\_policy split for each expired voucher** -> Org gets refund per configured split
  6. **[Member App] Corporate identity removed from member account** -> Welluber root account remains. Full claim history stays — visible to member only.
- **Grace window:** Deferred to post-MVP.
  - **History ownership:** Claim history belongs to the Welluber account, not the corporate identity. Benefits gone, history stays.

## Flow 16 — Member: Dependent Linking

---

**Design gap:** Dependent UX is not defined at interaction level. Data model supports dependents. Flow below is a proposed minimum — confirm with stakeholders before designing the screen.

1. **[Employee] Profile -> Dependents -> Add Dependent**
2. **[Employee] Enters: name, relationship, date of birth**
3. **[Backend] Creates dependent sub-account. Calculates pool per policy benefit\_pool\_type.** -> Individual pool or shared with employee — governed entirely by Policy.
  - **MVP scope:** Employee-managed only. Dependent self-registration is Phase 2.

## 7. Functional Requirements

### 7.1 Host Portal

Host Admin has full platform access — every feature listed across all portals is also available to Host. The list below is Host-exclusive or Host-primary capability.

| ID         | Requirement                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------|
| SYS-HST-01 | Manage global 3-level service taxonomy (Category -> Main Service -> Sub-service)                                        |
| SYS-HST-02 | Create, edit, clone, and deactivate Policies. View all policies with org assignment status.                             |
| SYS-HST-03 | Assign policies to one or more orgs. One policy can be shared across multiple orgs.                                     |
| SYS-HST-04 | Configure commission schemas per SP -- rate table by service category, separate rates for redeemed and expired vouchers |
| SYS-HST-05 | Approve, suspend, and reactivate Org and SP tenant accounts                                                             |
| SYS-HST-06 | Manage SP tax profile: is_tax_registered toggle, tax_reg_no, tax_rate per SP                                            |
| SYS-HST-07 | Aggregate platform-wide financials -- GMV, commissions, outstanding payouts                                             |
| SYS-HST-08 | Generate SP settlement reports; trigger settlement payouts                                                              |
| SYS-HST-09 | Configure expired voucher payout splits (% Org / % SP / % Welluber; must sum to 100%)                                   |
| SYS-HST-10 | Configure global cancellation window (default: 3 hrs) and global voucher redemption period (default: 15 days)           |
| SYS-HST-11 | Platform tax compliance dashboard: total SST collected across all SP transactions by period                             |
| SYS-HST-12 | Access any org or SP portal view in read or edit mode (god-mode override for support)                                   |

### 7.2 Organization Portal

HR sees a scoped version of the platform — restricted to their own org's data. Policy creation and editing are not available. Wizard-based flows abstract the underlying data model.

| ID         | Requirement                                                                                                                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SYS-ORG-01 | Configure corporate profile, branches, org structure, and PICs                                                                                                                                                                                       |
| SYS-ORG-02 | Bulk upload and manage employee profiles via CSV/Excel with row-level validation                                                                                                                                                                     |
| SYS-ORG-03 | Policy Assignment wizard (3-step): (1) select a Host-provisioned policy, (2) select employees, (3) review + confirm. Read-only view of policy contents. Employee entitlement amounts are derived from the policy — HR does not set amounts manually. |
| SYS-ORG-04 | Fund Branch Wallet via payment gateway (Cash Balance or Credit Limit). Employee entitlement is gated behind wallet balance — HR funds the wallet, the system allocates per policy.                                                                   |
| SYS-ORG-05 | Real-time utilization dashboard — spend by benefit group, employee drill-down, wallet balance                                                                                                                                                        |
| SYS-ORG-06 | Manual pool refresh trigger — HR can trigger a pool recalculation for an individual employee or full cohort from the utilization dashboard, outside the automated cron cycle.                                                                        |
| SYS-ORG-07 | Download Monthly Utilization Report: Gross, Net, SST breakdown, vendor SST registration no.                                                                                                                                                          |
| SYS-ORG-08 | Download Consolidated Tax Invoice: monthly SST summary for RMCD filing                                                                                                                                                                               |

## 7.3 Service Provider Portal

| ID        | Requirement                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SYS-SP-01 | Setup public branch profile -- hours, location, facilities, contact info                                                                                       |
| SYS-SP-02 | Create and publish packages: taxonomy mapping, service lines with weights (must sum to 1.0), final_price, redemption period, activation period, branch scoping |
| SYS-SP-03 | Member Lookup: QR scan -> Employee ID -> Name search (layered), with disambiguation display                                                                    |
| SYS-SP-04 | Walk-in claim submission: select service -> submit -> auto-deduct (no member handshake)                                                                        |
| SYS-SP-05 | Voucher code entry for redemption of online-purchased vouchers                                                                                                 |
| SYS-SP-06 | View claims ledger -- redeemed / expired / pending per branch                                                                                                  |
| SYS-SP-07 | Settlement statements: itemized payouts, commission deducted, next settlement date                                                                             |

|           |                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------|
| SYS-SP-08 | Review and one-tap approve auto-generated tax document (Payment Advice + pre-filled Tax Invoice template) |
|-----------|-----------------------------------------------------------------------------------------------------------|

## 7.4 Member App

| ID         | Requirement                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------|
| SYS-MEM-01 | 2-step registration: personal account -> corporate identity via magic link (universal link, opens app directly) |
| SYS-MEM-02 | Benefit wallet: benefit groups with remaining balance per group                                                 |
| SYS-MEM-03 | Marketplace: browse, search, filter; voucher detail; checkout. All prices SST-inclusive.                        |
| SYS-MEM-04 | Online co-payment via Welluber Payment Gateway                                                                  |
| SYS-MEM-05 | Active Voucher: TOTP code; all states (Pending / Active / Presented / Redeemed / Expired / Cancelled)           |
| SYS-MEM-06 | Voucher expiry display + push notification warnings                                                             |
| SYS-MEM-07 | Multiple corporate identities: one account, multiple linked identities                                          |
| SYS-MEM-08 | Digital ID card: QR code for walk-in identification at SP                                                       |
| SYS-MEM-09 | Transaction receipt: Gross, Net, SST component per transaction                                                  |

## 7.5 Core Engine

| ID         | Requirement                                                                                                              |
|------------|--------------------------------------------------------------------------------------------------------------------------|
| SYS-COR-01 | Single-currency model: 1 RM = 1 point                                                                                    |
| SYS-COR-02 | Pre-transaction validation: Benefit activation status (activation_mode) + Member pool + Org wallet (all three must pass) |
| SYS-COR-03 | Wallet blocking rule: wallet balance < employee policy entitlement -> purchase blocked                                   |
| SYS-COR-04 | Dual co-payment routing: online -> Welluber gateway; walk-in -> SP collects physically                                   |
| SYS-COR-05 | Auto-prorate benefits based on join date / probation end date                                                            |
| SYS-COR-06 | Cancellation cron: auto-cancel unpaid Pending vouchers after Host-configured window                                      |

|            |                                                                                                                                                                                                              |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SYS-COR-07 | Expiry cron: expire unredeemed Active vouchers after redemption period; trigger payout split                                                                                                                 |
| SYS-COR-08 | Commission calculation: per SP, per service category, weighted across multi-service vouchers. Formula: $\text{SUM}(\text{final\_price} \times \text{weight} \times \text{category\_rate})$ per service line. |
| SYS-COR-09 | SST de-calculation: if <code>is_tax_registered = TRUE</code> -> $\text{Net} = \text{Gross} / (1 + \text{tax\_rate})$ ; $\text{SST} = \text{Gross} - \text{Net}$ . Stored immutably on transaction record.    |
| SYS-COR-10 | Monthly auto-generation: Consolidated Tax Invoice (HR), Payment Advice + pre-filled Tax Document (SP)                                                                                                        |
| SYS-COR-11 | Benefit pool refresh: re-grant on configured refresh cycle (cron) or on manual HR trigger. Manual trigger does not reset the cron schedule.                                                                  |
| SYS-COR-12 | Structured error codes: backend returns codes; portals map to human copy                                                                                                                                     |

## 8. Access Control (RBAC)

**Access model:** Host Admin has full platform access by default -- every feature in every portal is available to Host. Org and SP portals are scoped-down views. Some pages differ in layout or wizard structure (e.g. policy creation vs policy assignment wizard) even when they cover the same underlying data.

| Tenant           | Role                 | Scope                                                                                                                                                                          |
|------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host             | Super Admin          | Full platform: taxonomy, policy creation/cloning/assignment, commissions per SP, settlements, global config, SP tax profiles, org + SP approval, god-mode access to any portal |
| Organization     | Super Admin (HQ HR)  | Policy assignment wizard (read-only policy contents), employee management, wallet funding, cross-branch reporting, tax reports                                                 |
|                  | Branch Admin         | Employee management + reporting for assigned branch(es). Policy assignment for own branch employees.                                                                           |
|                  | Finance / Accountant | Invoices, wallet top-ups, settlements, tax report export. No employee management.                                                                                              |
|                  | Manager              | Read-only utilization view for their team.                                                                                                                                     |
| Service Provider | Branch Manager       | Voucher creation, operating hours, branch claims view, staff management                                                                                                        |
|                  | Sales Agent          | Market vouchers, own sales performance. No dedicated MVP flows.                                                                                                                |
|                  | Staff                | Member lookup, voucher code entry, claim submission, daily transaction history                                                                                                 |
| Member           | Employee / Dependent | Marketplace, vouchers, co-payment, benefit balance, transaction receipts                                                                                                       |

## 9. Non-Functional Requirements

| ID     | Category      | Requirement                                                                                            |
|--------|---------------|--------------------------------------------------------------------------------------------------------|
| NFR-01 | Multi-Tenancy | Strict data isolation across all 4 tenant types                                                        |
| NFR-02 | Security      | PDPA compliant; PII + payment data encrypted at rest + in transit (TLS 1.2+)                           |
| NFR-03 | Performance   | Voucher code validation + confirmation < 3 seconds under normal load                                   |
| NFR-04 | Availability  | 99.9% uptime SLA                                                                                       |
| NFR-05 | Scalability   | Horizontally scalable; peak after-work wellness hours                                                  |
| NFR-06 | Mobile        | Magic link opens React Native app via universal link -- never browser redirect                         |
| NFR-07 | Tax Audit     | All SST de-calculation inputs stored immutably per transaction. 7-year retention per RMCD requirement. |

## 10. Open Decisions

### 10.1 Confirmed

| Decision                               | Resolution                                                                                     |
|----------------------------------------|------------------------------------------------------------------------------------------------|
| Magic link token expiry                | 60 minutes                                                                                     |
| Magic link routing                     | Frontend handles routing; backend handles token validation                                     |
| Member lookup priority                 | QR scan -> Employee ID -> Name search                                                          |
| Error UX                               | Structured codes from backend; portals map to human copy                                       |
| Settlement cycle                       | Monthly (assumed)                                                                              |
| Walk-in collision                      | Block walk-in; prompt SP to ask member to present existing voucher                             |
| Sales Agent role                       | Role option in dropdowns; no dedicated MVP flows                                               |
| Corporate deactivation -> vouchers     | Expire immediately; grace window post-MVP                                                      |
| Claim history post-departure           | Owned by Welluber account; member retains full history                                         |
| Marketplace without corporate identity | Browsable; checkout gated until identity verified                                              |
| Voucher redemption method (v1)         | Voucher code entry by SP -- not QR scan                                                        |
| SP wallet                              | None -- pure settlement ledger                                                                 |
| Wallet blocking rule                   | wallet < entitlement -> blocked                                                                |
| Commission model                       | Per SP, per service category -- rate table. Weighted across multi-service voucher lines.       |
| Commission basis                       | Working assumption: Gross Amount. Pending auditor confirmation.                                |
| Voucher pricing                        | Single final_price per voucher. Service lines carry proportional weights for commission split. |
| Tax display                            | All member-facing prices SST-inclusive (Gross)                                                 |
| Tax toggle model                       | is_tax_registered flag + tax_rate (default 8%) per SP. Not a full tax engine.                  |

|                      |                                                                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Policy ownership     | Host Admin creates, edits, clones, and assigns policies to orgs. HR cannot create or edit policy contents.                                                                                                                 |
| Claim Period         | Removed. Replaced by activation_mode (After Join Date / After Probation Ends). Error code CLAIM_PERIOD_* retired. New code: BENEFIT_NOT_ACTIVATED.                                                                         |
| Benefit as allowlist | Option A confirmed. Each service must be explicitly listed as a Benefit to be claimable. Default deny for unlisted services.                                                                                               |
| Portal access model  | Host Admin has full platform access by default. Org and SP portals are scoped-down views of the same platform. Some flows differ in layout (e.g. policy creation vs assignment wizard) but share the same underlying data. |

## 10.2 KIV -- Must Resolve Before Affected Area Is Designed

| Open Question                                | Blocks                                                | Note                                                                                                |
|----------------------------------------------|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| Commission on Gross or Net (ex-SST)?         | Settlement math, all commission examples              | Working assumption: Gross. Auditor must confirm.                                                    |
| Who is the taxable person -- Welluber or SP? | Entire Section 5 tax model, invoice chain             | Pending auditor review. Critical before any tax document is built.                                  |
| SP Tax Invoice: auto-generate or SP-upload?  | SP portal design (Flow 9, SYS-SP-08)                  | Recommendation: auto-generate on SP behalf. Pending auditor sign-off.                               |
| Wallet model -- single or Main + Add-on?     | Finance data model, reporting SST entity attribution  | Current: one wallet per branch. Multi-wallet concept not specced. Do not design around assumptions. |
| refresh_start_reference: Custom Date         | Benefit Assignment data model, prorate calc (EPIC 05) | Remove option or define validation rules first.                                                     |
| activation_mode: Custom Date                 | Policy engine spec (EPIC 05)                          | Same as above.                                                                                      |
| Public member account type                   | Member app nav architecture, onboarding               | Exclude from MVP (recommended) or define as browse-only.                                            |

|                                      |                                          |                                             |
|--------------------------------------|------------------------------------------|---------------------------------------------|
| Benefit re-assignment queue behavior | Pool refresh logic, next-cycle proration | What happens when policy changes mid-cycle? |
| SP T&C management                    | SP onboarding flow                       | Self-serve or Host-approved?                |
| Google Maps SDK provider             | SP branch setup, marketplace map         | Vendor + cost decision.                     |
| Payment Gateway provider             | Checkout, wallet top-up flows            | e.g. Billplz, iPay88, Stripe, FPX           |

### 10.3 Out of Scope (MVP)

- Hardware provisioning
- HRIS direct API integration (CSV only for v1)
- Multi-currency support
- SP pre-funded wallets
- Dependent self-registration (employee-managed only)
- Walk-in receipt generation for member
- QR scan for voucher redemption (v2)
- QR check-in for utilization tracking / gamification
- SP voucher pending-approval by Host
- Grace window for vouchers on corporate identity deactivation

## 11. Epics Summary

| Epic    | Area           | Description                                                                                                                       |
|---------|----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| EPIC 01 | Host           | Platform Configuration -- taxonomy, global config, expired voucher policy (Flow 1)                                                |
| EPIC 02 | Host           | Org Onboarding -- registration, approval, policy assignment, subscription (Flow 2)                                                |
| EPIC 03 | Host           | SP Onboarding -- registration, approval, commission schema, tax profile (Flow 3)                                                  |
| EPIC 04 | Host           | Policy Management -- create, configure, clone, assign to orgs. Benefit Groups + Benefits allowlist. (Flow 4)                      |
| EPIC 05 | Member         | Account Activation & Corporate Identity Linking -- magic link, two-inbox model (Flow 5)                                           |
| EPIC 06 | Org            | HR Enrollment Wizard -- profile setup, CSV upload, 3-step policy assignment, wallet funding (Flow 6)                              |
| EPIC 07 | SP             | Voucher Catalog -- weighted service lines, custom sub-service labels, single final_price, activation + redemption period (Flow 7) |
| EPIC 08 | Member         | Online Voucher Purchase -- validation chain, co-pay routing, voucher state machine (Flow 8)                                       |
| EPIC 09 | SP             | Walk-in Member Lookup + Claim -- layered ID, collision check, no handshake (Flow 10)                                              |
| EPIC 10 | SP             | Voucher Redemption -- code entry, state transitions, ledger entry (Flow 9)                                                        |
| EPIC 11 | Org + Host     | Settlement & Invoicing -- weighted commission, payout trigger, tax documents (Flow 12)                                            |
| EPIC 12 | Core + Finance | Tax & Compliance Engine -- SST de-calculation, immutable audit trail, auto-generated documents (Section 5)                        |
| EPIC 13 | Core           | Policy Engine -- pool type, utilization mode, refresh cycle, proration, manual trigger (Flow 13)                                  |

### First Three Actions

- Resolve architecture blockers:** (a) auditor sign-off on taxable person and commission basis, (b) public member account type in/out of MVP, (c) wallet model single vs multi. None can be designed around.

5. **API contract for Member Lookup** (docs/API\_CONTRACTS.md): activation\_mode eligibility filter, disambiguation fields, BENEFIT\_NOT\_ACTIVATED + ACTIVE\_VOUCHER\_EXISTS error codes. Unblocks EPIC 04.
6. **Lock universal link / deep link scheme** before EPIC 01 design. Browser fallback is not acceptable. Must be confirmed before magic link flow is prototyped.
